## 1 CEMENTITIOUS COMPOSITIONS AND CEMENTITIOUS SLURRIES 2 FOR PERMANENTLY PLUGGING ABANDONED WELLS AND 3 PROCESSES AND METHODS THEREFOR

## ABSTRACT OF THE DISCLOSURE

A dry cementitious composition which when slurried with water produces an economical hydraulic cementitious slurry for closing abandoned wells. The dry cementitious composition is a cement/CKD blend as the major component with a weight ratio of parts cement to parts of CKD between about 2/3 and about 3/1. Hydraulic cementitious slurries when cured can produce hard cementitious bodies which will or exceed the API specification for a competent hard plug. A process for blending the cement and CKD during transit from the cement source to the off-load site without requiring further blending after off-loading. Methods are provided for determining the formulation having the cheapest per unit volume of hydraulic cementitious thereby enabling competitive quotes based on cf of hydraulic cementitious slurry required.
